

Has Osteoarthritis of the Hand Affected You or Anyone In Your Family?

Cedars-Sinai is currently conducting research on the genetics of osteoarthritis of the hand.

The purpose of this study is to:

- Identify established and new, potentially important patterns of joint involvement in the hand
- Identify the presence of genes among families that may be associated with osteoarthritis of the hand
- Look for correlations between clinical and radiographic findings of osteoarthritis with genetics
- Find better treatments and possible prevention through any findings

Who is eligible? Anyone 45 years or older who is already diagnosed with hand osteoarthritis.

How Can I Get Involved?

For more information, please call our research staff at (310) 423-1232 or visit us at www.cedars-sinai.edu/osteoarthritisstudy. We welcome other family members, including brothers, sisters, parents, children or spouses. These relatives can live anywhere in the US and do not need to be diagnosed with hand osteoarthritis.
